                                                                                                                            The present invention describes nucleic acids (A) that interact stably contain at least one phosphoro(di)thioate contain, having endonuclease activity. (A), and more generally any catalytic conclusion and (A) that modulates expression of the osstrogen receptor conclusion and the surpression of the osstrogen receptor convivo or by transforming cells ex vivo and implanting treated cells, or correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of gene expression with alterations in phenotype, correlate (for RNA, in the same way that restriction endonucleases are consistence to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and AAA25992 represent their corresponding target sequences. AAA26107 to AAA26271 represent their corresponding target sequences and cantisense oligonucleotides used in the exemplification of the present corresponding target sequences and cantisense oligonucleotides used in the exemplification of the present corresponding target in the present corresponding target sequences. AAA26219 to AAA26271 represent other ribozyme sequences and cantisense oligonucleotides used in the exemplification of the present corresponding target in the present of the present corresponding target sequences.

                                                                                                                                                                             cc with a target sequence and contain at least one phosphoroidi) thicate CC link, having endonuclease activity. (A), and more generally any catalytic concleic acid (A') that modulates expression of the cestrogen receptor cC gene, are used to treat cancer (particularly of breast or endometrium). CC in vivo or by transforming cells ex vivo and implanting treated cells, or correlate inhibition associated with levels of cestrogen receptor. CC Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, cc reagents (for RNA, in the same way that restriction endonucleases are CC used with DNA). The combination of modifications in (A) improves CC reagence to nucleases, binding affinity and/or activity. AAA23503 to CC AAA24747 represent cestrogen receptor hammerhead ribozyme sequences, and AAA25992 represent their corresponding target sequences. CC AAA25993 to AAA262018 represent their corresponding target sequences. AAA26219 to AAA26218 represent their corresponding target and continense oligonucleotides used in the exemplification of the present corresponding target sequences and continense oligonucleotides used in the exemplification of the present corresponding target in the present corresponding target sequences.

                                                                                                                                                                                                                                                                                                          CC link, having endonuclease activity. (A), and more generally any catalytic concludes acid (A) that modulates expression of the osetrogen receptor concludes are used to treat cancer (particularly of breast or endometrium), conviction are used to treat cancer (particularly of breast or endometrium). CC in vivo or by transforming cells ex vivo and implanting treated cells, or corrected the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of gene expression with alterations in day research creagents (for RNA, in the same way that restriction endonucleases are consistence to nucleases, binding affinity and/or activity. AAA23503 to CAAA24747 represent osetrogen receptor hammerhead ribozyme sequences, and AAA26105 represent their corresponding target sequences. CaAA24748 to AAA26105 represent their corresponding target sequences and AAA26107 to AAA26271 represent obstrogen receptor hairpin ribozyme sequences and cantisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                Query Match

                                                                                 밁
                                                                                                                                                                                                                                                                                      CC gene, are used to treat cancer (particularly of breast or endometrium).

CC in vivo or by transforming cells ex vivo and implanting treated cells, or CC for other conditions associated with levels of cestrogen receptor.

CC Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, CC particularly for identification of therapeutic targets, and as research CC reagents (for RNA, in the same way that restriction endonucleases are CC used with DNA). The combination of modifications in (A) improves CC resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and CC AAA24747 represent costrogen receptor hairpin ribozyme sequences.

CC AAA24748 to AAA25092 represent their corresponding target sequences. CC Gequences, and AAA26107 to AAA26218 represent their corresponding target sequences and AAA26219 to AAA26271 represent other ribozyme sequences and cantisense oligonucleotides used in the exemplification of the present corresponding target sequences and contisense oligonucleotides used in the exemplification of the present corresponding target sequences.
                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel retroviral expression vector (A) CC containing DNA sequences (I) for packaging vector RNA and for cell-containing DNA sequences of proteins or peptides encoding by heterologous DNA CC (II). The sequences controlling cell-specific expression contain a cell-specific expression vector size and experience. The invention also describes (a) mRNA and CC RNA of (A); (b) prokaryotic and eukaryotic cells containing (A); (c) CC eukaryotic cells containing (A) in integrated form; (d) virions (CC containing a retroviral expression vector RNA derived from (A); (e) a CC method for producing the virions of (d); (f) a method for incorporating (CC protein-encoding nucleic acid sequences into a eukaryotic cell by (CC containing (A) and a packaging cell line, that contains at least one (CC containing (A) and a packaging cell line, that contains at least one (CC proteins of (A). (A) are used for cell- or tissue-specific expression of (CC foreign genes for gene therapy and to produce virions for introducing (CC proteins within the U3-R segment, but without their disadvantages (excessive strength and limited cell specificity). Since (A) are derived from endogenous (harmless) viral sequences, they do not introduce any new (viral sequences) into the converse and veccombination of introduce any new (viral sequences) that proceed the form of the forms and veccombination.
                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                     Ś
                                                                                                                                                                                                                                                                                                              Query Match

The present sequence is that of a phosphorothioate oligonucleotide CC containing 20 T nucleobases, each having a 2'-methoxyethoxy group on its CC irribosyl sugar moiety. It is an example of an oligomeric compound CC produced according to the methods of the invention. The invention CC provides compounds and methods for the preparation of mixed backbone CC oligomeric, or chimeric, compounds having phosphodiester internucleoside linkages. The methods also include incorporation of CC phosphonate internucleoside linkages. The methods also include incorporation of CC phosphonate internucleoside linkages. The methods also include incorporation of CC contiguous region is subsequently oxidized to phosphodiester, CC linkages prior to further elongation. Mixed backbone oligomeric compounds CC linkages prior to further elongation. Mixed backbone oligomeric compounds CC linkages prior to further by oxidizing adjacent regions with different care prepared in this manner by oxidizing adjacent regions with different coxidation steps that oxidize a region of 1 or more H-phosphonate internucleoside linkages without degrading existing linkages that have been previously oxidized. The oligomucleotides obtained are useful as primers in PCR, probes, linkers, gene fragments and for other diagnostic cand an antiviral acontral acon

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, ERR3/COUP-TF-1, the GARA transcription factor gene, IRF-2 and/or the CAATT Displacement protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropojetin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ribozyme; erythropoietin; granulocyte colony stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hammerhead ribozyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor prointerferon alpha and erythropoietin.

molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EARJ/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of

The present invention relates to enzymatic and antisense nucleic acid

erythropoietin,

granulocyte

colony stimulating

genes involved in the production imulating factor protein and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    interferon alpha
                                                                                                                                                                                          The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                   Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                               12-APR-1999;

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, nervous system injury. and

Claim 88; Page 80; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a consistency an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) processing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) process of CD20 in the presence of a divalent cation that is preferably Mg^2+. CC furthermore, it may be contacted with a call to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-cc treat lymphoma (NHI), bulky low-grade or follicular NHI, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHI, mantle-cell lymphoma (NCI), immunocytoma (INC), small B-cell lymphocytic lymphoma (LC), immunocytoma (INC), small B-cell lymphocytic lymphoma (LC), immunocytoma (INC), small B-cell lymphocytic lymphoma, leukaemia, and inflammatory arthropathy. The NOGO-crayetting nucleic acid may be contacted with a cell to reduce NOGO gene in the coll and treat a patient having a condition associated with the level of coll and treat a patient having a condition associated with the level of therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident collection, at rocke), Alvheimer's disease. Jementia. multiple aclerosis (MS). (CVA, stroke), Alzheimer's disease,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The preser
The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
                                                                                                                                                                                                                                   Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human NOGO Inozyme #161.

CC DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr CC an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA CC with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA CC with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA CC of CD20 in the presence of a divalent cation that is preferably Mg^2^+. CC furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more CC treat lymphoma (NHI), bulky low-grade or follicular non-CC leukaemia, HIV (human immunodeficiency virus) associated NHI, lymphocytic lymphoma, (NCI), immunocytoma (INC), small B-cell lymphocytic lymphoma, (NCI), immunocytoma (INC), small B-cell lymphocytic lymphoma, immunocytoma (INC), small B-cell lymphocytic lymphoma, cell card may contacted with a cell to reduce NCOO gene in the CC targetting nucleic acid is used to cleave RNA of the NCOO gene in the CC therapies. In particular, the NCOO-targetting nucleic acid may be used to cleave RNA of the NCOO activity of the CC therapies. In particular, the NCOO-targetting nucleic acid may be used to creat central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), C chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), C chemotherapy-induced neuropathy, and/or other neurodegenerative disease (C sements high respond to the modulation of NCOO expression. The present caters which respond to the modulation of NCOO expression. The present

is a hammerhead ribozyme of

```
CC expression of a CD20 gene and a nucleic acid molecule which down regulates compression of a CD20 gene and a nucleic acid molecule which down completes expression of a country of a neurite growth inhibitor gene (NOGO). The CC mucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a CC DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule country) and country of country of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; Parkinson's disease; ataxia; Huntington's disease; Creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative dis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNAzyme; inozyme; G-cleaver; amberzyme; zinzyme; lymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia; human immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis;

                                                                                                                                                                                                  The present invention relates to oligonucleotides that downregulate the expression of human Grb2-related with Insert Domain (GRID) gene. GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemocherapy and cyclosporin treatment. The present oligonucleotide was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                            New nucleic acid(s) for regulating the Grb2-related (GRID) gene comprises using antisense and enzymatic molecules such as hammerhead ribozymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ABL46735 standard; RNA; 17

The Zmax1 and HB genes have esteopathic activities. The genes can be used in gene therap antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, Pager's disease, sclerostogis, osteomalacia and fibrous dysplasia.

Pager's disease, sclerostogis, osteomalacia and fibrous dysplasia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes the human Zmax1 gene and the high bone mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 and HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, in the diagnosis and treatment of bone disorders including osteoporosis,

The present sequence represents an oligomer used in the screening of the hgDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published pct sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as the concentration and the proteins of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gu Y,
                                                                                                                                                                                                                                                        therapeutic supplement in patients having specific deficiency in hGDMLP-production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 05-FEB-2001; 2001US-0266860P

                                                                                                                                                                                                                                                                                                                                                                                                                                                          individual control of the provide initial substrates for the recombinant engineering of hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP -1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence in the exemplification of the present invention. N.B.

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        he present invention describes a human genome-derived myosin-like rotein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-can be used in gene therapy and vaccine production. The hGDMLP-1 ucleic acids can be used as probes to detect, characterise and quantify

nucleic acids can be used as probes to detect, characterize and quantify CC highMLP-1 nucleic acids in samples, as amplification substrates, to CC provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as the therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The CC polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a CC disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence in the exemplification of the present invention. N.B. CC The sequence in the exemplification of the present invention. N.B. CC HGDMLP-1 sequence in the exemplification of the printed CC specification, but was obtained in electronic format directly from WIPO at fig. wipo.int/pub/published_pct_sequence

CC protein 1 (hgDMLP-1). The protein and polynucleotide sequences of hgDMLP-1 cc 1 can be used in gene therapy and vaccine production. The hgDMLP-1 cc nucleic acids in sembles to detect, characterise and quantify cc hgDMLP-1 nucleic acids in samples, as amplification substrates, to cc provide initial substrates for the recombinant engineering of hgDMLP-1 cc protein variants having desired phenotypic improvements, and for cc expressing the proteins. The hgDMLP-1 proteins or polypeptides may be cused as immunogens to raise antibodies that specifically recognise hgDMLP-1 capture probes for surface-enhanced laser description ionisation, as computed for the reapeutic supplement in patients having specific deficiency in hgDMLP-1 conduction, and in vaccines or for replacement therapy. The cc polynucleotide sequences encoding hgDMLP-1 may be used for diagnosing a cd disorder associated with the expression of hgDMLP-1, in particular heart cand skeletal muscle disorders. hgDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hgDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO capture for int/nuh/hibishad not accommence.

The present invention describes a human genome-derived myosin-like CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1 cC nucleic acids can be used as probes to detect, characterise and quantify cC hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 cC protein variants having desired phenotypic improvements, and for cexpressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP cused as immunogens to raise antibodies that specifically recognise hGDMLP capture proteins, as standards in assays used to determine the concentration cand/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as concentration, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.
                                                                                                                                                                             Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 17

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10p12.1. HTPL and its coding sequence are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
The invention relates to a method for identifying a molecule involved in lipid regulation comprising identifying a molecule that binds to or inhibits binding of a molecule to high bone mass (HBM) or its wild type gene, Zmax1. Compounds identified by the method are useful for treating, diagnosing, preventing or screening for normal and abnormal lipid-associated conditions, including arteriosclerosis, cardiovascular disease, stroke, and osteoporosis. The compounds may also be used in the treatment or prevention of diabetic atherosclerosis, neurovascular conditions caused by plaque build-up, poor circulation due to plaque build-up and associated poor wound healing. The methods may be used in gene therapy, pharmaceutical development, and diagnostic assays for bone
                                                                                                                                                                                                                                                        Identifying molecules involved in lipid regulation, useful diagnosing, treating or preventing e.g., arteriosclerosis, identifying a molecule that binds to high bone mass gene or corresponding wild type gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             osteoporosis; atherosclerosis; diabetic atherosclerosis; plaque build-up; neurovascular condition; wound healing; gene therapy; PCR primer; probe; bone development disorder; antiarteriosclerotic; cardiovascular;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human Zmax1 cDNA reverse PCR primer #232.

The invention relates to a method for identifying a molecule involved in C1 lipid regulation comprising identifying a molecule that binds to or c1 inhibits binding of a molecule to high bone mass (HBM) or its wild type C2 gene, Zmaxl. Compounds identified by the method are useful for treating, C3 diagnosing, preventing or screening for normal and abnormal lipid-C4 associated conditions, including arteriosclerosis, cardiovascular C5 disease, stroke, and osteoporosis. The compounds may also be used in the C5 treatment or prevention of diabetic atherosclerosis, neurovascular C6 treatment or prevention of diabetic atherosclerosis, neurovascular C7 conditions caused by plaque build-up, poor circulation due to plaque C6 build-up and associated poor wound healing. The methods may be used in C7 gene therapy, pharmaceutical development, and diagnostic assays for bone C7 development disorders. Molecules identified by comparison of Zmaxl and C7 development, in diagnosis of human or animal bone disease, and in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      treatment of bone diseases. Sequences ABK22776-ABK23411 represent cDNA molecules encoding human Zmax1 and HBM, and PCR primers, probes, linke and adapters of the invention
                                                                                                                This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, PAPP-E. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform actions of the contraction of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 17 BP; S A; S C; 4 G; 3 T; 0 U; 0 Other;

                                                                                                                                                                                                The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or rissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen thereby bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstruct pulmonary disease (COPD), chronic bronchitis and asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (RIBO-)

                                                                                                                                                The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (MAV). The nucleic acid molecules are useful for treating a condition related to MNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic molety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                      Claim 23; SEQ ID NO 1131; 495pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                  of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, nurvologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least tripe of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 175214 are not given in the specification. The present sequence is that of a nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid molecule that modulates replication of West Nile (WNV), useful for treating a condition related to WNV infection e. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatit encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 23; SEQ ID NO 14421; 495pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                   of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of mucleic acid molecules further comprise at least ting of mucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid molecule that modulates replication of West Nile (WNV), useful for treating a condition related to WNV infection e. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Blatt

The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least then 2'.O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleic tides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid

The invention relates to a novel isolated 17 mer nucleic acid sequence, CC given in the specification, a sequence containing at least 15 consecutive CC nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence with, after optimal CC dignment, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, coplypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for CC preparation of pharmaccuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell containing the acids. The polypeptides can also be used to generate antibodies, and containing the patient samples is useful for diagnosis and/or prognosis of these containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing ABT39507 standard; DNA; 17 l Similarity 15; Conserv AGTGCAGTGGTGATC 495 AGTGGAGTGGTATGATC 1 Conservative u A; 1.4%; 7 C; 1 G; 4 T; 0 U; °, Score 13.8; DB 1; Pred. cc nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that the hybridizes to them under highly stringent conditions, or the complement co f any of them, or the corresponding RNA. The novel isolated nucleic conditions of the invention are useful as probes and primers for detecting, conditioning quantifying and/or amplifying and primers for detecting, conditioning the nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, con polypeptides, vectors containing the nucleic acids, cells containing the polypeptides, vector or antibodies directed against the polypeptides are useful for corporation, specifically cancer but also Alzheimer's disease and condiseases that are characterised by development of tumours or cell content samples is useful for diagnosis and/or prognosis of these condiseases. The polypeptides can also be used to generate antibodies, and components of protein contents. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression contents of protein contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              of any of them, or the corresponding RNA. The novel isolated nucleic CC acids of the invention are useful as probes and primers for detecting, CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC component of a gene chip, in vitro as (anti)sense reagents, and for CC production of recombinant polypeptides. Any of the nucleic acids, cpl properties, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for CC preparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell CC excises that are characterised by development of tumours or cell CC excises that are characterised by development of tumours or cell CC excises. The polypeptides can also be used to generate antibodies, and CC excises. The polypeptides can also be used to generate antibodies, and CC both the polypeptide and antibodies are useful as components of these chips. The nucleic acid sequences of the invention can be used in gene characy. This polynucleotide sequence represents a tumour suppression of the invention can be used in gene contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            acids of the invention are useful as probes and primers for detecting, dentifying, quantifying and/or amplifying anucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression crelated human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression;

cc component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, colypeptides, vectors containing the nucleic acids, cells containing the polypeptides are useful for cector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral containing the prevention and/or treatment of viral containing the polypeptides are useful for diseases that are characterised by development of tumours or cell contained to the polypeptide of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these contained the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene charapy. This polynucleotide sequence represents a tumour suppression con contained the contained to the invention can be used in gene contained the polynucleotide sequence represents a tumour suppression contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be useful to the invention can be use

Telerman A, Amson R, Tuijnder

WPI;

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Disclosure; Page 249; 720pp; French

given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one

                 The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; ge antisense; sense; tumour; cell degeneration; cancer; Alzheimer's schizophrenia; protein chip; gene therapy; tumour suppression;
                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid, useful for treating viral diseases with tumors and cell degeneration, also related polypeptides, and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             17-SEP-2001; 2001FR-00011978.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17-SEP-2002; 2002WO-IB004208
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          27-MAR-2003

Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      12-JUN-2003
